The Need for Repo Clearing
By Nigel de Jong

Over the past year or so, it has become evident that repo clearing is essential for achieving efficiency in all market conditions. This is reflected in the growing demand for cleared repo, which, according to EU SFTR data included in the latest ICMA European repo survey, represents around 50% of outstanding loan value of the overall repo market, a trend fuelled in part by concerns highlighted during the COVID-19-driven volatility around access to safe and secure funding. This was especially acute in March 2020, when liquidity was at a premium and secured funding was in demand.

As a result of these stresses, some buy-side firms struggled to access secured repo markets and started to review their toolbox of execution options for when such a crisis repeats itself. This highlighted the ongoing need for repo clearing, not just as a safety net for difficult times, but as a mechanism for achieving better pricing and adequate capacity in both volatile and calm markets.

ENDURING BENEFITS

While recent events have focused attention, the core benefits of repo clearing are enduring. In particular, balance sheet netting helps both sell-side and buy-side market participants by creating capacity that dealers can provide to their clients. Effective balance sheet management is critical; netting reduces risk and frees up capital to finance growing debt in the EU and elsewhere. This includes EU SURE bonds and Next Generation first issuance, which offer vital help for employment schemes throughout the EU, and the growing list of ESG government issuance.

This is good news for users of a service such as LCH RepoClear, which delivers an opportunity for an array of netting benefits that are significantly enhanced by the size of its liquidity pool. For buy-side repo participants, this access to liquidity is underpinned by capacity, risk management and efficiency — the three most important components of any repo service.
LCH is a unique financial infrastructure provider that allows you to benefit from an array of clearing services, across securities, rates, credit, equities and FX.

Volumes at LCH RepoClear have soared by more than 50% in the 10 years from 2010 to 2020. This is important for all repo participants, as both the concentration of available liquidity and the breadth of coverage are essential to providing participants with strong risk management and access to a range of cleared repo markets. The larger the netting pool, the greater the likelihood of a nettable trade and better price. With 14 debt markets in its netting pool, LCH RepoClear has a positive impact on capacity, which translates to better prices for buy-side clients.

OPEN FOR BUSINESS

Unlike a vertical exchange silo, LCH RepoClear is open and connected (see Figure 1). That means we operate how participants want, not the way we tell them to. This Open Access mentality drives us to be innovative, to partner with the market and to develop solutions that are primarily in the interests of participants.
At LCH RepoClear, this openness extends to our location, with services available in the UK and Paris, providing access across regulatory borders to a diverse, global membership, including our newest members in Luxembourg, Canada, Japan and Switzerland. LCH SA’s RepoClear service for Europe is a great example of this, demonstrating resilience by providing access to deep liquidity and margin stability during last year’s market stress.

LCH RepoClear’s clearing member network continues to expand, as does our innovative product offering, which has seen the growth of sponsored clearing and the addition of new products. And with both UK- and EU-based clearing houses, LCH RepoClear is uniquely positioned to continue delivering a seamless and diversified service for UK and European repo and cash bond markets with versatile trading and settlement optionality.

Participants looking to clear repo in the UK or Europe have choices, regardless of their market situation. But for those looking for access to the most liquidity, balance sheet netting opportunities, a predictable margin environment and an array of operational efficiencies, there is really only one option.
